## Water Treatment within Central Heating Systems – The Benefits!

1. A quieter boiler results from the removal of lime scale build up on the heat exchanger.
2. Hotter Radiators and a quicker warm up from the removal of Black Sludge “Magnetite” cold spots.
3. A longer lasting system, pumps will last longer and radiators will have an extended life if there is no corrosion present and suitable corrosion inhibitors are used.
4. Lower fuel bills due to a more efficient system, costs more to heat solid magnetite than it does water!  
Estimated that up to 25% saving can be made.
5. Helps to comply with The Benchmark Code of Practice when installing new boilers on old or new installations.
6. A safer environment when under taking system cleaning, self contained unit, no taking radiators of the wall and struggling not to get black sludge on carpets etc.

The correct method of cleaning and inhibiting various types of Central Heating Systems using a powerflushing system will ensure satisfaction to the end user and installer.

By having your system Powerflushed by a qualified operator will give peace of mind for years to come.

Powerflushing will not cause leaks or pin holing! If this occurs during flushing it will be due to the removal of debris from an infected area – a disaster waiting to happen if your installer was not present!
